# ① "FINITE AUTOMATA WITH OUTPUT"

## Mealy and Moore Machine

- \* An Automaton in which the output depends only on the input is called an automaton without a memory. An
- \* Automaton in which the output depends on the states as well, is called automaton with a finite memory.
- \* An automaton in which the output depends only on the states of the machine is called a Moore machine.
- \* An automaton in which the output depends on the state as well as on the I/P at any instance of time is called a Mealy machine.

Mealy machine:  $\rightarrow$  The value of the output function  $z(t)$  in the most general case is a function of the present state  $q(t)$  and the present input  $x(t)$ , i.e.

$$z(t) = \lambda(q(t), x(t))$$

where  $\lambda$  is called the output function. This generalized model is usually called the Mealy machine.

Moore machine:  $\rightarrow$  If the output function  $z(t)$  depends only on the present state and is independent of the current input, the output function may be written as

$$z(t) = \lambda(q(t))$$

This restricted model is called the Moore machine.

It is more convenient to use Moore machine in automata theory.

## Most General Definition of Moore and Mealy machine ②

Moore Machine! →

A Moore machine is a six tuple

$(Q, \Sigma, \Delta, \delta, \lambda, q_0)$ , where

- (i)  $Q$  is a finite set of states;
- (ii)  $\Sigma$  is the input alphabet
- (iii)  $\Delta$  is the output alphabet
- (iv)  $\delta$  is the Transition function  $\Sigma \times Q$  into  $Q$ ;
- (v)  $\lambda$  is the output function mapping  $Q$  into  $\Delta$ ;
- (vi)  $q_0$  is the initial state.

Mealy machine! →

A Mealy machine is a six tuple

$(Q, \Sigma, \Delta, \delta, \lambda, q_0)$ , where all the symbols except  $\lambda$  have the same meaning as in the Moore machine.

$\lambda$  is the output function mapping  $\Sigma \times Q$  into  $\Delta$

For Example, Table 1 describes a Moore machine. The initial state  $q_0$  is marked with an arrow. The table defines  $\delta$  and  $\lambda$ .

Table 1: - A Moore machine

Present state	Next state $\delta$		Output $\lambda$
	$a=0$	$a=1$	
→ $q_0$	$q_3$	$q_1$	0
$q_1$	$q_1$	$q_2$	1
$q_2$	$q_2$	$q_3$	0
$q_3$	$q_3$	$q_0$	0

For the Input string 0111, The transition of states is given by  $q_0 \rightarrow q_3 \rightarrow q_0 \rightarrow q_1 \rightarrow q_2$ . The output string is 00010.

For the Input string  $\Lambda$ , The output is  $\lambda(q_0) = 0$ .

Transition Table 2 describes a Mealy machine. (3)

A Mealy machine

Present state	Next state			
	$a=0$		$a=1$	
	state	output	state	output
$\rightarrow q_1$	$q_3$	0	$q_2$	0
$q_2$	$q_1$	1	$q_4$	0
$q_3$	$q_2$	1	$q_1$	1
$q_4$	$q_4$	1	$q_3$	0

Note!  $\rightarrow$  For the input string 0011, the transition of states is given by  $q_1 \rightarrow q_3 \rightarrow q_2 \rightarrow q_4 \rightarrow q_3$ , and the output string is 0100.

In this case of a Mealy machine, we get an output only on the application of an input symbol. So for the input string  $\Lambda$ , the output is only  $\Lambda$ . It may be observed that in the case of a Moore machine, we get  $\lambda(q_0)$  for the input string  $\Lambda$ .

- \* For a Moore machine if the input string is of length  $n$ , the output string is of length  $n+1$ . The first output is  $\lambda(q_0)$  for all output strings.
- \* In the case of a Mealy machine if the input string is of length  $n$ , the output string is also of the same length.

(4)

\* Procedure for Transforming A Mealy machine into a Moore machine? →

We develop procedure for Transforming a Mealy machine into a Moore machine and vice-versa so that for a given input string the output strings are the same (except for the first symbol) in both the machines.

Example!— Consider the Mealy Machine described by the Transition table given by following table. Construct a Moore machine which is equivalent to the Mealy machine.

Present state	Next state			
	Input $a=0$		Input $a=1$	
	State	Output	State	Output
→ $q_1$	$q_3$	0	$q_2$	0
$q_2$	$q_1$	1	$q_4$	0
$q_3$	$q_2$	1	$q_1$	1
$q_4$	$q_4$	1	$q_3$	0

Sol<sup>n</sup>!— At The first stage we develop the procedure so that both machines accept exactly the same set of input sequences. we look into the next state column for any state, say  $q_i$ , and determine the number of different outputs associated with  $q_i$  in that column.

⑤ We split  $q_i$  into several different states, the number of such states being equal to the number of different outputs associated with  $q_i$ . For Example, in this Problem,  $q_1$  is associated with one output 1 and  $q_2$  is associated with two different outputs 0 and 1. Similarly,  $q_3$  and  $q_4$  are associated with the outputs 0 and 0, 1, respectively. So, we split  $q_2$  into  $q_{20}$  and  $q_{21}$ . Similarly,  $q_4$  is split into  $q_{40}$  and  $q_{41}$ . NAD table (above) can be reconstructed for the new states as given by following table.

State table for Example:

Present state	Next state			
	input $a=0$		input $a=1$	
	state	output	state	output
$\rightarrow q_1$	$q_3$	0	$q_{20}$	0
$q_{20}$	$q_1$	1	$q_{40}$	0
$q_{21}$	$q_1$	1	$q_{40}$	0
$q_3$	$q_{21}$	1	$q_1$	1
$q_{40}$	$q_{41}$	1	$q_3$	0
$q_{41}$	$q_{41}$	1	$q_3$	0

The pair of states and outputs in the next state column can be rearranged as given by table following table.

Table:- Revised state table

⑥

Present state	Next state		output
	a=0	a=1	
$\rightarrow q_1$	$q_3$	$q_{20}$	1
$q_{20}$	$q_1$	$q_{40}$	0
$q_{21}$	$q_1$	$q_{40}$	1
$q_3$	$q_{21}$	$q_1$	0
$q_{40}$	$q_{41}$	$q_3$	0
$q_{41}$	$q_{41}$	$q_3$	1

Table "above" gives the Moore machine. Here we observe that the initial state  $q_1$  is associated with 1. This means that with input  $\Lambda$  we get an output of 1, if the machine starts at state  $q_1$ . Thus this machine accepts a zero length sequence (null sequence) which is not accepted by the Mealy machine.

To overcome this situation, either we must neglect the response of a Moore machine to input  $\Lambda$ , or we must add a new string state  $q_0$ , whose state transitions are identical with those of  $q_1$  but whose output is 0. So, table "above" is transformed to table "below"

Table:- Moore machine of Example "above"

(7)

Present state	Next state		output
	a=0	a=1	
→ q <sub>0</sub>	q <sub>3</sub>	q <sub>20</sub>	0
q <sub>1</sub>	q <sub>3</sub>	q <sub>20</sub>	1
q <sub>20</sub>	q <sub>1</sub>	q <sub>40</sub>	0
q <sub>21</sub>	q <sub>1</sub>	q <sub>40</sub>	1
q <sub>3</sub>	q <sub>21</sub>	q <sub>1</sub>	0
q <sub>40</sub>	q <sub>41</sub>	q <sub>3</sub>	0
q <sub>41</sub>	q <sub>41</sub>	q <sub>3</sub>	1

from the foregoing procedure it is clear that if we have an  $m$ -output,  $n$ -state Mealy machine, the corresponding  $m$ -output Moore machine has no more than  $mn+1$  states.

~~Procedure for transforming a Mealy machine into a Moore machine :-~~ ~~we develop procedure for transforming~~

Procedure for Transforming a Moore Machine into a Mealy machine:  $\rightarrow$

We modify the acceptability of Input string by a Moore machine by reflecting the response of the Moore machine to input  $\lambda$ . We thus define that Mealy machine  $M$  and Moore machine  $M'$  are equivalent if for all input strings  $w$ ,  $bZ_M(w) = Z_{M'}(w)$ , where  $b$  is the output of the Moore machine for its initial state. We give the following result: Let  $M_1 = (Q, \Sigma, \Delta, \delta, \lambda, q_0)$  be a Moore machine. Then the following procedure may be adopted to construct an equivalent Mealy machine  $M_2$ .

Construction :  $\rightarrow$

(i) We have to define the output function  $\lambda'$  for the Mealy machine as a function of the present state and the input symbol. We define  $\lambda'$  by

$$\lambda'(q, a) = \lambda(\delta(q, a)) \quad \text{for all states } q \text{ and input symbol } a.$$

(ii) The transition function is the same as that of the given Moore machine.

Example:-

(9)

Consider a Mealy machine represented by fig. Construct a Moore machine equivalent to this Mealy machine.

Mealy machine of Ex.

Sol:- Let us convert transition diagram into transition table  
Transition table for Ex.

Present state	Next state			
	a=0		a=1	
	state	output	state	output
→ q <sub>1</sub>	q <sub>2</sub>	z <sub>1</sub>	q <sub>3</sub>	z <sub>1</sub>
q <sub>2</sub>	q <sub>2</sub>	z <sub>2</sub>	q <sub>3</sub>	z <sub>1</sub>
q <sub>3</sub>	q <sub>2</sub>	z <sub>1</sub>	q <sub>3</sub>	z <sub>2</sub>

for the given problem: q<sub>1</sub> is not associated with any output;  
q<sub>2</sub> is associated with two different outputs z<sub>1</sub> and z<sub>2</sub>;  
q<sub>3</sub> is associated with two different ~~states~~ outputs z<sub>1</sub> and z<sub>2</sub>. Thus we must split q<sub>2</sub> into q<sub>21</sub> and q<sub>22</sub> with outputs z<sub>1</sub> and z<sub>2</sub>, respectively and q<sub>3</sub> into q<sub>31</sub> and q<sub>32</sub> with output z<sub>1</sub> and z<sub>2</sub>, respectively.

Following <sup>table</sup> shows The Transition of Moore machine (10)  
For Example.

Present state	Next state		output
	a=0	a=1	
→ q <sub>1</sub>	q <sub>21</sub>	q <sub>31</sub>	
q <sub>21</sub>	q <sub>22</sub>	q <sub>31</sub>	z <sub>1</sub>
q <sub>22</sub>	q <sub>22</sub>	q <sub>31</sub>	z <sub>2</sub>
q <sub>31</sub>	q <sub>21</sub>	q <sub>32</sub>	z <sub>1</sub>
q <sub>32</sub>	q <sub>21</sub>	q <sub>32</sub>	z <sub>2</sub>

Figure gives The Transition diagrams of The required Moore machine

Fig:- Moore Machine of Ex.

Ex:- Construct a Mealy machine which is equivalent to the Moose machine given by table given below (11)

Present state	Next state		Output
	a=0	a=1	
→ q <sub>0</sub>	q <sub>3</sub>	q <sub>1</sub>	0
q <sub>1</sub>	q <sub>1</sub>	q <sub>2</sub>	1
q <sub>2</sub>	q <sub>2</sub>	q <sub>3</sub>	0
q <sub>3</sub>	q <sub>3</sub>	q <sub>0</sub>	0

Sol<sup>n</sup>:- We must follow the reverse procedure of converting a Mealy machine into a Moose machine. In the case of the Moose machine, for every I/P symbol we form the pair consisting of the next state and the corresponding output and reconstruct the table for the Mealy machine.

For example, the state q<sub>3</sub> and q<sub>1</sub> in the next state column should be associated with output 0 and 1, respectively.

The transition table for the Mealy machine is given by table below

Present state	Next state			
	a=0		a=1	
	State	Output	State	Output
→ q <sub>0</sub>	q <sub>3</sub>	0	q <sub>1</sub>	1
q <sub>1</sub>	q <sub>1</sub>	1	q <sub>2</sub>	0
q <sub>2</sub>	q <sub>2</sub>	0	q <sub>3</sub>	0
q <sub>3</sub>	q <sub>3</sub>	0	q <sub>0</sub>	0

Note:- we can reduce the number of states in any model by considering states with identical transitions.

If Two states have identical Transitions (i.e. the rows corresponding to these two states are identical), then we can delete one of them.

Example:- Consider the Moore Machine described by the transition table given by table "below" construct the corresponding Mealy machine.

Present state	Next state		Output
	$a=0$	$a=1$	
$\rightarrow q_1$	$q_1$	$q_2$	0
$q_2$	$q_1$	$q_3$	0
$q_3$	$q_1$	$q_3$	1

Solution:-  $\rightarrow$  we construct the Transition table as in the following table by associating the output with the transitions. In the table below, the rows corresponding to  $q_2$  and  $q_3$  are identical. So we can delete one of the two states, i.e.  $q_2$  or  $q_3$ . we delete  $q_3$ .

Present state	Next state			
	$a=0$		$a=1$	
	State	Output	State	Output
$\rightarrow q_1$	$q_1$	0	$q_2$	0
$q_2$	$q_1$	0	$q_3$	1
$q_3$	$q_1$	0	$q_3$	1

The table next to it, gives the reconstructed table.

# final Mealy Machine of Example
