

## Parity

↳ It is a concept to detect errors

↳ A single bit error is detected by it.

↳ For more than one bit parity is not used

↳ Let the signal be 4 bit, which is transmitted, so it will have error or noise

↳ So parity is an extra bit send with the signal ~~at~~

↳ This extra bit tells as the total no. of 1s

0100 → no. of 1s is 1  
Tx signal

↳

Parity

odd parity      even parity

Ex:-

0100    1  
└───┘    ↑  
original    Parity  
Signal    bit

0100 1 → even parity

The overall signal should be even  
no. of 1's are even.

1100 0 (Even Parity)  
Signal

In this whole signal is even.

\* Odd Parity

0100 0 → overall signal is  
          ↑  
odd parity    odd

1100 1    overall signal is  
                  odd

94 signal  $\boxed{01001}$ , has a noise added

$\boxed{01011}$  CRx but the parity bit is even but Rx signal is odd parity so there is an error.

## Hamming Code

H.W

Assign the proper even parity bit to the following

- a) 1010      b) 111000      c) 101101  
d) 1000111001001      e) 101101011111

Q

even all the above questions can be solved for odd parity.

# Hamming Code | Error Detection

- ↳ Given by R.W. Hamming
- ↳ Easy to implement
- ↳ 7-bit Hamming Code is used commonly
- ↳ Tx & Rx data when transmitted through a channel detects noise or gets noise effect the signal.

## Rules

- 1) Data bits :- data bits. (4) bits
- 2) Parity bits (extra bit sent along with data bit to detect error)

(3) bits

For 7 bits

4 (data bits)

3 (parity bit)

$$2^P \geq m + P + 1$$

$m \rightarrow$  Data bit  
 $P =$  parity bit

$2^n$  {where  $n = 0, 1, \dots, n$ } position of parity bits

$$2^0 = 1 \quad n = 0$$

$$2^1 = 2 \quad n = 1$$

$$2^2 = 4 \quad n = 2$$

$$n = 3 = \underline{2^3 = 8} \text{ (bits are more than 7)}$$

Rest bits are data bits

$$P_1 \rightarrow D_3 D_5 D_7$$

For Ex:- Even Parity

$$P_2 \rightarrow D_3 D_6 D_7$$

$$P_3 \rightarrow D_5 D_6 D_7$$

7	6	5	4	3	2	1
111	110	101	100	011	010	001
$P_4$				$P_2$	$P_1$	

$$P_1 \rightarrow 1 \oplus 3 \oplus 5 \oplus 7 \rightarrow 3, 5, 7$$

$$P_2 \rightarrow 2 \oplus 3 \oplus 6 \oplus 7 \rightarrow 3, 6, 7$$

$$P_4 \rightarrow 4 \oplus 5 \oplus 6 \oplus 7 \rightarrow 5, 6, 7$$

Ex:- 1011, Transfer with even parity

D <sub>7</sub>	D <sub>6</sub>	D <sub>5</sub>	P <sub>4</sub>	D <sub>3</sub>	P <sub>2</sub>	P <sub>1</sub>
1	0	1	/	1	/	/
7	6	5	4	3	2	1

$$P_1 \rightarrow 3 \ 5 \ 7$$

$$1 \quad 1 \quad 1$$

$$P_3 \rightarrow 5 \ 6 \ 7$$

$$0 \quad 1 \quad 0$$

$$P_2 \rightarrow 3 \ 6 \ 7$$

$$0 \quad 1 \quad 0$$

7	6	5	4	3	2	1
1	0	1	0	1	0	1

→ Data send

D<sub>7</sub> D<sub>6</sub> D<sub>5</sub> P<sub>4</sub> D<sub>3</sub> P<sub>2</sub> P<sub>1</sub>

If noise is added.

D<sub>7</sub> D<sub>6</sub> D<sub>5</sub> D<sub>3</sub>  
 1 1 1 0 1 0 1 (Rx signal)  
           P<sub>4</sub> P<sub>2</sub> P<sub>1</sub>

$$P_1 \rightarrow 3 \ 5 \ 7$$

$$1 \quad 1 \quad 1$$

$$P_2 = 3 \ 6 \ 7$$

$$0 \quad 1 \quad 1 \quad x$$

$$P_4 \rightarrow 5 \ 6 \ 7$$

$$0 \quad 1 \quad 1 \quad x$$

So error is recognized

## Hamming Code - Error Correction

Ex:- If the 7 bit Hamming Code word received by the receiver is 1011011

Assuming the even parity state, whether the received code word is correct, wrong  
If wrong locate the bit having error.

Soln:-

7	6	5	4	3	2	1
1	0	1	1	0	1	1

$P_1$

$P_1$  3 5 7  
1 0 1 1

↓  
odd parity  
which is wrong

$P_1 = 1$

$P_2$

$P_2 = 3$  ~~6~~ 7

1 0 0 1

even parity

→  $P_2 = 0$

$P_4 = 1$

5 6, 7  
1 0 1

$P_4 = 5$  6 7

1 1 0 1 → odd parity

$P_4$  has error

so make  $P_4 = 1$

$P_4$   $P_2$   $P_1$

(1 0 1) = 5 (So 5th bit is having error)

7 6 5 4 3 2 1  
1 0 0 1 0 1 1

Correct code send by sender

H.W

a) A 7 bit hamming code is 0101101.  
Having ~~even~~<sup>odd</sup> parity, check whether  
the code is correct or not and detect  
the error

by
