Mon deterministie Automate :->
Non-Determinism means a choice of mores for an automaton. Rather than Plescribing a unique more in each situation, we allow a set of Possible mores. Formally, we achieve this by defining the parsition function so that its range is a set of possible

Destriction! - A nondeterministic finite automete or NFA is defined by the quadruple M=[B, E, S, 90, F), where Q, E, 40, Fare defined as for deterministic finite automate, but 8: Qx(EU(x))-72Q

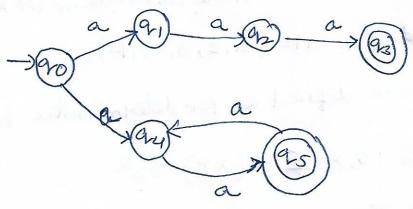

Mote that There are There regar differences of this definition and the definition of a dea.

D'In a mon deterministie altometa, The range of d in The Powerset 20, so that its rake is not a single element of Q. but a subset abit. This susper defines the set of all Possible states that can be leached by The Transition. It for Instance, The Current state is quis tree symbol a is lead, and 8(9,00) = 790,92}

tren either to or 92 Could be the rest state of the nfa. D) Also we allow I as the second argument of S. This Means that no far can make a Transition without consuming an

(3) Finally, in an NFA, The Set $\{ \{ \{ \{ \}_{i,j} \} \} \}$ no transition defined for this specified situation. A String is a ccepted by an NFA if there is some Sequence of Possible moves thatwill Put The Machine in a final state at The end of the String. A string is lejected (Treat is, not bossible accepted) only if There is no Possible sequence of moves by which a final state cause leached Ex!— Consider the Transition graph in house

Ex! - Consider the Transition graph in figure, it describes aboled a out of go.

Ex! - Transition system for a rondeterministic autometing

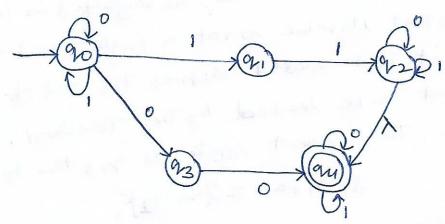

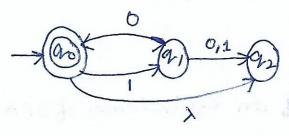

Fig: - NDA/NFA autometion with entry Move

in figure. It is nondeterministic automators is shown in figure. It is nondeterministic not only because several edges with the same label originate from one verter, but also because it has A-Transition, some transitions, such as d(9,10), are unspecified in the graph. This is to be interpreted as a Transition to the empty set, that is, s(9,10) = p. The automa accepts strings A, 1010, and 101010, but not 110 and 10100, plote that for 10 there are two althoughts, one ladip to 9 the other to 92. Even Though as is not a final state. The

Recap!

FA without D/P

FA without D/P

Mealy machine Moose Machine λ -NFA NFA DFA

[ontput with associated input with states $0 \times 20 \times 10^{-3}$ $0 \times 2 \times 20 \times 10^{-3}$ $0 \times 2 \times 20 \times 10^{-3}$

- The equivalence of DFA and NDFA!— we naturally Try to first the selation blw DFA and NDFA. Intuitively, we now seed that:
- (i) A DFA can simulate the behaviour of NDFA by increasing the number of states. (In other woods, a DFA (0, Σ , 8, 90, F) Carbe viewed as an NDFA (0, Σ , 8', 90, F) by defining $S'(9, a) = \{S(9, a)\}.$)
- (ii) Any NDFA is a Mose general machine without being Mose Powerfell.

* we row give a Theosen of on equivalence of DFA and NDFA.

Theosem:
For every NDFA. There exists a DFA which

Simulates The behaviour of NDFA. Alternatively, if L is

The ser accepted by NDFA, Then There exists DFA which

accepts L.

Proof! - let M= (B, Z, 8, 90, F) be an NDFA accepting L. We construct a DFA M' as:

M'= (Q', E, S, 90, F')

Lar, 92, - 2i) any state in Q' is denoted by

- (i) 20 = (20) and
- (11) F' is The set all sussets of a Contain an element of F.

(S) (S) $(S(a_3,a_1), ---a_iJ, a) = S(a_1,a) \cup S(a_2,a)$ $\cup S(a_3,a) \cup ---- \cup S(a_i,a)$.

Equivalently,

If and only if
$$8(\{a_1, --a_i\}, a) = \{P_1, P_2 - P_i\}$$

Example: Construct a delerministic autometers equipments $M = (\{90,91\}, \{0,1\}, \delta, 90, \{90\})$

where S is defined by its state table (a)

(a)	State/2	0 11 2	deally or control by suched
	>(90)	go	91
			2012)
	91	· · ·	Shirter That are designed

Solution: - for The deterministic automators M,

(i) The states are subset of [20,91], i.e., \$, [20],(2)],
(20,191];

- (i) [20] is the initial state;
- (11) [90) and [90,91] are the final states as there are the only states contains 90; and
- (1) Sin defined by the state table given by Table and (a).

Table! - State table of M, For example

Ate/Z	0	1
ϕ	ø	\$
[ao]	[20]	Laj
Lanj	[91]	[20,91]
[10,00]	[90,91]	[ao, 2,]

The states go and on appear in the rows Corresponding to go and on and the column corresponding to o.

208/a so, 8 ([90,4,],0) = (90,91].

beten M has n states, The corresponding finite automators has in states. Hawever, we need not Consmut of for all These in States, but only For Those states that are leachable from [90].

This is secured our interst is only in construction MI accepting T(M). 80, noe start the construction of 8 for [90]. We continue by considering only the states appearing earlier under the 1/P columns and Construction of for such states. we halt when no more real states appear under the imposit columns.

of some set of hands and the

Example; had a deterministic acceptor equivalent to M= (120, an, ary, {a, b}, 8, 20, 1229) watere 8 is given by table given below State / -390 90,91 90 goog 1 The delerministic automation M, Equivalent to of is defined as follows: MI= (20, 22,6), 8, [20], F') F= [[92], [90,92], [9,92], [90,9,192] nee Start The Construction by considering [90] first.

whele

we get (an) and [90,94]. Then we construct 8 For [2] and [90,91]. [a,,92] is a real state appearp unde the input columns. Ablir consmetip S for Carilla)

we do not get any new states and to we

tearninate the Consmittings. The state taske in sienty Table: - State table of MI for about ep.

Some question on DFA

a. Consmut a DFA, that accepts set afall string over Z= {a,b} af length 2

Soln!-

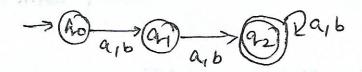

L= Jaa, ab, ba, bb}

a. Construct a DFA, That accept set of all strings over Z={a13} hehere length is atleast 2.

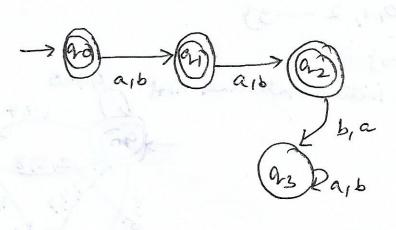

Solui-

L= 2aa, ab, ba, bb, aaa, aab, --- 3

Z= 20,63, 1W152

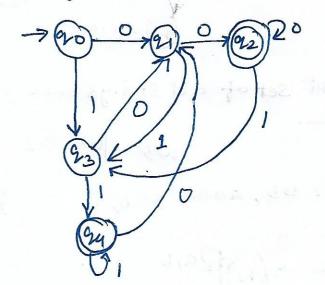

801":- L=jë,a,b,aa,ab,ba,bb3

* If EisTre Part of The lang then always makes initial state as final state

$$\frac{2^{\circ}}{1} = \frac{2^{\circ}}{1} =$$

* Design a DFA treat leads Strings made up at [0,13 and accept only those Strings waits ends up in either over 11.

Here the FA has two different. I shall states on and one. On state accepts strip endip with 11.

* Construct a DFA that accepts The set of natural numbers & which are divisible by 3.

801":- Let $M = \{8, 2, 90, 8, F\}$ be a DFA with $S = \{90, 91, 92\}$ $\Sigma = \{0, 1, 2 - --9\}$ $F = \{90\}$

i.e. here go is initial state and high State also.
